EDUCATION

University of Cincinnati, M.S., Computer Science
KL University, B.Tech. in ECE, Minor in Data Science

May 2026

May 2022

TECHNICAL SKILLS

Programming: JavaScript, TypeScript, Python, Java, SQL, C, HTML, CSS

Application Development: React.js, Angular, FastAPI, Spring Boot, REST APIs, Microservices, Streamlit, Node.js, Web Audio API

Cloud & DevOps: Azure, Azure DevOps, AWS, Docker, Kubernetes, Helm, ArgoCD, Terraform, Ansible, IaC, Jenkins, CI/CD, Git, GitHub

AI & Data: RAG, ChromaDB, LangChain, Scikit-learn, Pandas, NumPy, Snowflake, Databricks, PySpark

Delivery & Monitoring: Linux, Prometheus, Grafana, CloudWatch, Agile/Scrum, JIRA

WORK EXPERIENCE

Software Engineer Intern | *Cleveland Clinic*

Jun 2026 – Present

- Built the ClinParse pipeline in Python and FastAPI using GPT-OSS APIs to extract structured fields from unstructured clinical notes, reaching up to 87% clinician-reviewed accuracy, and built the reviewer-facing front end in React.js so clinicians could check extracted fields against the original note and export results to Excel and HTML.
- Designed schemas on top of the existing clinical database to support structured storage of extracted fields, and built client-side views using HTML5, CSS3, and JavaScript frameworks including React.js and jQuery.
- Built the front-end for the colonoscopy surveillance tool as a React.js single-page app, using functional components and React hooks (useState/useEffect) to manage UI state across the flag-review, reasoning-display, and letter-approval screens, and calling REST endpoints on the FastAPI backend to fetch patient records and submit clinician decisions.
- Developed the backend logic for that same surveillance tool, pulling patient data from Snowflake and our EDV system and applying ASGE guideline rules to flag patients due for follow-up, covering 326K+ records across 92+ providers at 82% accuracy, with the system drafting the follow-up letter for 69% of flagged cases.
- Set up a Llama-3.3-70B notes-extraction pipeline over a 2010-2025 rectal cancer patient directory and surfaced the output through a Git-versioned Streamlit dashboard for physician-level trend review.
- Built a Python, PySpark, and Databricks pipeline using GPT-OSS-20B to extract 80+ intraoperative variables from 96K+ operative records at approximately 73% field-level accuracy.
- Reviewed teammates' pull requests on the application and API code, focused mainly on error handling and long-term maintainability.

Graduate Research Assistant | *University of Cincinnati*

Feb 2025 – Mar 2026

- Built TruVox UI features using React.js and TypeScript, delivering real-time pitch tracking and visual feedback for transfeminine users completing gender-affirming voice therapy exercises.
- Developed structured pitch-modulation exercises and audio-processing logic, integrating the Web Audio API to power live pitch visualization and voice-monitoring feedback.
- Designed a customizable, avatar-based UI and containerized the application with Docker for consistent, repeatable deployment.

DevOps Engineer | *Nokia (T-Mobile)*

Jun 2022 – Jun 2024

- Designed and maintained Azure DevOps YAML pipelines for 5G repository checks, artifact promotion, deployments, upgrades, and validation, improving consistency and reducing manual intervention.
- Managed Kubernetes releases with Helm and Azure Pipelines across lab and production to support horizontal scalability.
- Developed reusable Terraform and Ansible modules to standardize infrastructure as code and configuration across development, staging, and production, reducing environment setup time.
- Implemented ArgoCD and Helm GitOps workflows across lab and production, enforcing repository and artifact-integrity checks to improve deployment consistency and auditability before promotion.
- Improved release security and compliance with Kubernetes secrets, network policies, and post-deployment health checks.
- Used Prometheus, Grafana, and Azure Monitor for observability and root-cause analysis of complex application, container, DNS, TCP/IP, and HTTP/HTTPS issues, reducing mean time to recovery by 40%.
- Authored deployment, validation, rollback, and production-support runbooks, partnering with Nokia engineers and T-Mobile stakeholders through Agile ceremonies to strengthen incident readiness.

Programmer Analyst Trainee | *Cognizant*

Apr 2021 – May 2022

- Developed and deployed fault-tolerant REST APIs with Java, Spring Boot, and SQL Server, achieving 99.9% service uptime and reducing API response time by 30%.
- Built Angular login, audit, and results UI features, integrating four REST APIs to connect user workflows with back-end services.
- Tested REST API functionality and end-to-end data flows with Postman to verify application behavior across the UI and back end.
- Integrated back-end services with AWS EC2, S3, and RDS for cloud deployments, reducing infrastructure costs by 15%.
- Delivered full stack Java/Spring Boot and Angular features across four Agile sprints, gathering requirements and automating workflows.

PROJECTS

AI-Powered Career Guidance System

- Built Streamlit and FastAPI tools enabling conversational search across colleges, courses, scholarships, and career opportunities.
- Orchestrated a LangGraph agent routing college, course, scholarship, and career queries through ChromaDB retrieval, deploying on AWS with Terraform and automated CI/CD.

AI-Powered Bank Statement Analyzer

- Built a Python/Streamlit app to clean Excel bank statements, categorize expenses, and visualize spending with Pandas and NumPy.
- Used LangChain and GPT-4 to categorize transactions and tailor financial guidance to spending patterns and demographics.

CERTIFICATIONS

- Microsoft Azure Fundamentals | **Microsoft**
- Source Code Management Using Git & GitHub | **AICTE**

- AWS Certified Cloud Practitioner | **AWS**
- AWS Certified Solutions Architect | **AWS**
